ABOUT BOTOX®

Botox® is an FDA approved purified protein which is injected into targeted muscles and temporarily blocks nerve signals that cause muscle movements, essentially relaxing the muscle which reduces or eliminates fine lines and wrinkles.

Within 3-5 days of the Botox® injection, the treated facial muscles become temporarily relaxed, causing the overlying skin to lay flat and unwrinkled. The untreated facial muscles contract in a normal fashion allowing facial expressions to be unaffected.

Botox® injections only take a few minutes and will remain effective for approximately 3 months. With regular treatments, Botox can help train your facial muscles to reduce wrinkles and facial pain for longer periods of time.

Our professionals can administer your treatments with exceptional accuracy and precision. Because Botox® is a temporary treatment, for your convenience, these treatments can be scheduled to coincide with your other routine appointments.

Millions of people use Botox® to achieve a more relaxed and smooth facial appearance, while still having the freedom of expression. Combining this with other esthetic treatments like dermal fillers, you will have a more youthful and relaxed appearance.

Millions of people also suffer from TMJ syndrome, chronic migraine, headaches, and other types of facial pain. You may have tried a number of different treatments for facial pain relief that have had little success. Botox can be very effective in treatment of facial pain disorders when used in conjunction with other treatments

Now you can radiate beauty and find pain relief by receiving Botox® treatments from our doctors who have been specially trained in total facial esthetics and facial pain treatment.
